

ABSTRACT OF THE DISCLOSURE

A mailbox sheet discharge designation environment which flexibly deals with various requests from each user and inhibits a user's load is provided. In this environment, a host computer registers plural discrimination names including a user name and names of plural groups to which a user corresponding to the user name belongs for each of plural holding units of an image recording apparatus, and then transmits a printing job including sheet discharge address designation by the plural registered discrimination names to the image recording apparatus. The image recording apparatus registers in a memory the plural discrimination names transmitted from the host computer to each of the holding units, and then discharges the printing job to the holding unit to which the discrimination name same as the discrimination name designated to the printing job has been registered.
